# THE LOST CITY OF POMPEII

When will the volcano that buried this ancient civilization blow again?

A deafening boom roars through Pompeii's crowded market place. The ground shakes violently throwing the midday shoppers off balance even the public baths, an arena, gladiators' barracks, restaurants, and even a hotel. People start screaming and pointing towards Mount Vesuvius, a massive volcano that rises above the bustling city, located in what is now southern Italy.

## THE SKY IS FALLING

Vesuvius had been silent for nearly 2,000 years, but it roared back to life, shooting ash and smoke some 20 miles into the air. Almost overnight, the city and most of its residents vanished under a blanket of ash and lava.

Through the excavation that started in 1748 and continued to this day, scientists' report has been able to recreate almost exactly what happened to Pompeii on that terrible day.

The thick ash turned everything black. People couldn't see the sun. All the landmarks disappeared. They

didn't have the foggiest idea which way they were going. Some people ran for their lives, clutching their valuable coins and jewellery. Other people took shelter in their homes. But the debris kept falling. Piles grew as deep as nine feet in some places, blocking doorways and caving in roofs. At 7 a.m., 18 hours after eruption, the last fiery surge buried the city.

#### LOST AND FOUND

Visiting the ruins of Pompeii today is like going back in time. The layers of ash actually helped preserve buildings, artwork, and even the forms of bodies. There are kitchen with pots left on the stove and bakeries with loaves of bread—now turned to charcoal – still in the ovens.

#### WARNING SIGNS

Pompeii may be an ancient history, but there's little doubt that disaster will strike again. Luckily people living near Vesuvius today will likely receive evacuation warnings before the volcano blows. Scientists are closely monitoring Vesuvius shifts in the ground, earthquakes, and rising levels of certain gases, which could be signs of an upcoming eruption!!!!

## Comparison of Numbers

Apparently, 987 (a 3-digit number) is smaller than 1023 (a 4-digit number).  
We can write it as  $987 < 1023$  or  $1023 > 987$ .

Now, compare the following pairs of numbers by inserting ' $<$ ' or ' $>$ ' or ' $=$ ' in the boxes :

- |                                   |                      |                                |                                   |                      |       |
